

## CATEGORY: Drilling & Abandonment TMT Seabed Soil Sampler

Engineered Tooling Solutions *FAST*

The TMT Seabed Soil Sampler is one of the simplest forms of seabed sampling. It is a grab bucket very similar to that used on land.

The advantage of the TMT version is that it very simple and not restricted to any water depth other than the ROV limit. It can provide an idea of the seabed floor properties.

The tool is typically deployed from an ROV manipulator, then recovered back to deck. The tool is also useful in obtaining bulk samples that can be used back in laboratories for model testing such as soil pipeline interaction etc.

The tool can be customised to suit the client's requirements.

### Features:

- Cost-effective
- Large capacity
- Field proven
- Corrosion resistant materials

### Specifications:

- |                              |                    |
|------------------------------|--------------------|
| • Dimensions                 | Ø174 x316L x576Hmm |
| • Weight in Air - Empty      | 4.6kg              |
| • Weight in Seawater - Empty | 3.0kg              |
| • Handles Supported          | Varies             |
| • Depth Rating               | Unlimited          |
